AI software engineer building and operating production healthcare voice assistants end to end, from conversational workflows and scheduling integrations to versioned delivery, evaluation, observability, and incident response.

EXPERIENCE

TechAhead - AI Software Engineer, Hoag Medical Group

Oct 2025 - Present

- Built the GitOps delivery platform for production healthcare voice AI, turning assistants, tools, squads, evaluations, and simulations into versioned resources with schema validation, drift detection, approval-gated promotion, and reversible cutovers, making releases reviewable and reproducible.
- Designed multi-agent scheduling across intent routing, slot selection, qualification, patient intake, booking, and human handoff; extended the NestJS/FHIR bridge for batch and combo appointments, retryable validation, and fuzzy location matching so failures return actionable recovery paths.
- Built a PHI-conscious investigation and evaluation stack across Vapi, AWS S3, SQLite, and DuckDB, joining transcripts, recordings, tool events, and structured outputs to turn call failures into reproducible regressions and evidence-backed reliability decisions.

TechAhead - Client Solutions Architect

Apr 2025 - Present

- Translate ambiguous product discovery into AI and backend architectures, working prototypes, cost-aware delivery plans, and technical proposals that align client goals with what engineering can ship.

Teaching Solved - Founding Engineer

Aug 2024 - Mar 2025

- Architected and shipped the initial educator marketplace across Next.js, PostgreSQL, and AWS, integrating authentication, payments, file delivery, analytics, and retrieval-assisted discovery for culturally relevant content.

InduzBuy - Software Engineer Intern

May 2023 - Aug 2023

- Modernized a legacy PHP commerce platform in Laravel, automated its deployment path, and replaced manual catalog processing with a repeatable BERT classification workflow.

ICICI Lombard GIC - Software Engineer

Oct 2019 - Aug 2022

- Decomposed insurance services for independent scaling and built a Neo4j decision engine that made complex premium rules easier to change, trace, and test.

SELECTED PROJECTS

Cloudflare Devkit - Built a Bun/TypeScript toolkit with validated starter shapes and reusable GitHub Actions, standardizing how Workers, Hono APIs, scheduled jobs, D1, and R2 services are created and shipped. github.com/adhipk/cloudflare-devkit

Dotlocal - Built a local-first editor and publisher for technical data stories, combining live preview and in-browser Marimo notebooks with project-scoped Cloudflare publishing so source remains portable.

Hyperspace - Built an HTML-first workspace that unifies coding-agent sessions, live task state, and project artifacts over an append-only event stream with live SSE updates.

SKILLS

AI: Voice agents, agent orchestration, LLM evaluations, RAG, observability · **Backend & data:** TypeScript, Bun/Node.js, Python, Java, NestJS, Hono, FHIR, PostgreSQL, SQLite, DuckDB · **Platforms:** Cloudflare Workers, AWS, Docker, GitHub Actions, Terraform, React, Next.js

EDUCATION

M.S. Computer Science, Arizona State University

2022 - 2024

B.Sc. Mechanical Engineering, Minor in Computer Science, PES University

2015 - 2019
